

Mozn Jamous

End-to-End Product Builder — design → develop → deploy

I design products, build the mobile apps, and engineer the systems behind them.

From research and UX through Flutter development, AI integration, and business-operations systems — I take products from idea to shipped reality. Currently designing & building product at Santa Media.

3 Products designed & built	1 Production ERP implementation	3 AI-powered product experiences	Design → Dev → Deploy Owned end-to-end
---------------------------------------	---	--	--

About

I'm a product builder with an Information Technology Engineering degree and a design-first way of working. I started by building a healthcare app for my graduation thesis — designed in Figma, built end-to-end in Flutter, with three AI models behind an Arabic-first interface.

Since then I've worked across the full line of a product: the interface, the Flutter app, the backend, the AI integration, and the business systems products run on — a bilingual Design System, a mobile rebuild, and a production Odoo ERP, all within the last year.

I'm most useful to small teams that need one person who can research a problem, design the solution, and ship it — especially for Arabic-first or bilingual products.

Skills & tools

DESIGN

- Figma
- Design Systems
- Prototyping
- Arabic UX
- RTL
- Accessibility

BACKEND

- Python
- Flask
- Supabase
- PostgreSQL
- REST APIs

SYSTEMS

- Odoo 19
- ORM
- QWeb
- OWL
- POS · HR · Payroll

MOBILE

- Flutter
- Dart
- iOS + Android

AI

- Google Gemini
- LoRA-tuned models
- Random Forest

WEB & ALSO

- HTML/CSS/JS
- Brand sites
- Vue
- NestJS · TypeScript
- Manual QA
- IEEE 830

How I work — from a problem to a shipped product

I don't start with screens. I start with the problem, decide what to build and why, then take it all the way to production — and keep it running.

01

Discover

Work out who has the problem and what's actually at stake — before any UI.

BloomBelly: four maternal-health journeys mapped before a line of code.

02

Design

Decide the architecture and the tradeoffs first; information architecture before pixels.

CareConnect: three audiences → three focused apps, not one role-switcher.

03

Build

Implement what I designed — the Flutter front-end, the backend and data model, the AI or business logic.

Mademoiselle: stalled prototype rebuilt natively on a 26+ component system.

04

Improve

Shipping is the start — access control, edge cases, and whether the next person can keep it alive.

Smart Expense: role-based access at the data layer, open-sourced under LGPL-3.0.

Selected work — product & design

Flutter / AI products taken from research and Figma through to a shipped app.

Mademoiselle — Santa Media

2026 — Present

UI/UX + Flutter · Design System · Designer + Lead Flutter Dev · Commerce / Beauty

Stalled FlutterFlow prototype → live native app.

A FlutterFlow prototype had stalled in production with no clear path forward. I started in Figma — a full UI redesign and a bilingual Design System of 26+ components across three themes and both writing directions — then rebuilt the app natively in Flutter. Now active and shipping.

Figma Flutter Design System RTL AI Integration

BloomBelly

2025 · Graduation thesis

UI/UX + AI · Arabic-first · Designer + Developer · Healthcare

Three AI models behind one Arabic-first app.

Arabic-speaking mothers had no AI health guide in their language. I mapped four user journeys in Figma, designed Arabic-first with full RTL, then integrated three AI models behind one Flutter interface — Gemini for vision, a LoRA-tuned transformer for Arabic Q&A, and a Random Forest for nutrition — calibrated to refuse rather than hallucinate on health questions. Graduation thesis at Al-Sham Private University.

Figma Flutter Flask Gemini LoRA RTL

CareConnect

2024

UI/UX + Mobile · Full-stack · Designer + Developer · Childcare marketplace

Three focused apps on one provable backend.

Childcare platforms fail by building one interface for three completely different users. I designed three separate Figma files — one per audience — each built around how that person actually thinks, then built three focused Flutter apps over a single Supabase backend with access enforced at the database layer (RLS), so the apps physically can't read each other's data.

Figma Flutter Supabase PostgreSQL RLS IEEE 830

Eda — multi-tenant clinics platform

2026 · Team build

Healthcare · Multi-tenant · Designer + QA tester

Tested that the wall between clinics holds.

A multi-tenant clinics platform built with a collaborator (@xvtu2003): three Flutter apps over a NestJS / TypeScript backend, each clinic isolated as its own tenant. Working from the project's requirements, I designed the screens across the apps and was the tester who verified the system — including the data isolation between clinics, the one guarantee a healthcare platform can't break.

Flutter NestJS TypeScript Multi-tenant Manual QA

ERP & business systems — operations, engineered

Custom Odoo 19 systems for real companies — expense management, HR, payroll, attendance, POS, and approval workflows. Built around how a business actually works, not Odoo's defaults. One module is open source and live on GitHub.

LGPL-3.0

Smart Expense — open
source & live

Featured implementations — two businesses, live on Odoo

Techno Solution — a 3-division company

2025 — Present

Odoo Developer · Systems Designer · Import / warehousing / solar

HR, payroll, attendance, purchasing, inventory, and accounting for an import / warehousing / solar company — one Odoo system replacing a scattered Excel operation. Still live after handoff.

18 employees · **6,514 hours** tracked · **140 purchase orders** · **884 inventory moves**

Burgasm — a restaurant, fully on Odoo

2025 — Present

Odoo Developer · Systems Designer · Restaurant / hospitality

Proper books, a live point of sale, a kitchen display, and inventory tracked down to the ingredient — a restaurant run end-to-end on Odoo. 30+ modules configured around the way the kitchen and till actually run.

68 accounts (3 partners, dual-currency) · **500+ POS orders** · **10,000+ ingredient moves** linked to POS · **30+ modules**

WHAT I'VE BUILT

- Expense management — receipt → approval → journal entry
- HR — employees · contracts · hierarchy
- Attendance — check-in/out, linked to payroll
- Payroll — salary rules · automated runs
- Point of sale — live restaurant POS
- Approval workflows — email-based, no login

WHAT GOES INTO THEM

- Custom Odoo modules — Python · XML · ORM
- Workflow automation — server actions · cron · Studio
- Access control — record rules · 3-tier RBAC
- Reporting — QWeb PDF · scheduled email
- API integrations — REST · external systems
- Localization — full EN / AR · RTL

RESULTS THAT MATTER

APPROVAL TIME

Cut expense approvals from **days to seconds** — by removing the login requirement entirely. The approval lives in the email; one click moves the request forward.

MANUAL WORK

Replaced paper-based workflows with automated ones — receipts, approvals, journal entries, and monthly department reports that used to be typed by hand now generate themselves.

OPERATIONS

Moved two businesses onto Odoo — a three-division company and a restaurant — each its own company on one deployment, replacing scattered Excel operations.

Selected systems

Takhrjy — a seven-role ERP (Vue)

2025 · Team build

Designer + QA tester · Custom graduation-gifts business

Not every ERP is Odoo. Takhrjy is a Vue system a team built for a custom graduation-gifts business — a seven-role permission model (super admin, sales, production, local delivery, international shipping, wholesale, accountant), a six-stage order pipeline, retail and wholesale, and local plus international fulfillment. Working from the team's requirements I designed the system's screens, and I was the tester who verified it worked before launch.

7 user roles · **6-stage** order pipeline · retail + wholesale · local + international fulfillment

Smart Expense Manager — open source

2025 · LGPL-3.0

Odoo Developer · github.com/Mozn-jamous/smart-expense-manager

A custom Odoo 19 module that replaces paper expense flows with token-secured, one-click email approvals routed through the hr.employee hierarchy — no login required. Journal entries are generated automatically on finance sign-off (only on approval, never on submission, so the ledger stays clean); monthly PDF reports are emailed by cron. Three-tier RBAC is enforced at the record-rule layer, and everything ships in full English and Arabic.

cron

account.move

Client & brand websites

Brand sites designed and built from scratch in vanilla HTML/CSS/JS — Arabic-first, fast, and deployable with no build step.

Pharmacology — clinical-nutrition brand

2026 · Client work

Web · Design System · Bilingual · Designer + Front-end Developer (complete redesign)

A drifted inherited site → a clean, systematised v3.

A complete redesign and from-scratch rebuild of the brand & service site for a clinical-nutrition practice (client: Dr. Ahmed Elkhateeb, Pharm.D). 25 fully bilingual (Arabic-first, RTL) pages on a single locked design-token system and one ~30-component library, built in vanilla HTML/CSS/JS with no build step, and Supabase-wired apply + waitlist forms. RTL-native: all copy lives in one bilingual dictionary, layout uses CSS logical properties throughout.

25 pages · EN / AR RTL-first · locked **design tokens** · **~30 components** · Supabase forms

Noodlna — food brand storefront + B2B

2026 · Client work

Web · Brand · B2B · Designer + Front-end Developer · Client: Syria Macarna

One brand site for two audiences — shoppers and distributors.

Designed and built the website for Noodlna, an instant-noodles brand by Syria Macarna: an Arabic-first consumer storefront that sells the product (hero, flavor range, a three-minute cooking ritual, recipes, reviews, heritage), plus a separate B2B page that opens wholesale, export, and private-label partnerships with commercial specs and an export-request funnel (WhatsApp + form). Vanilla HTML/CSS/JS, RTL, deployed on Vercel.

2 audiences (consumer + B2B) · **Arabic / RTL** · vanilla HTML/CSS/JS · deployed on **Vercel**

Under the hood — the full-stack line

One stack; every layer is something I've actually built, not theory — each shown with the product it came from.

Frontend

Flutter · Dart

One codebase, iOS + Android, Arabic-first and RTL.

Cross-platform UI from a single Dart codebase · Arabic-first / RTL layouts (not bolted-on translation) · a shared design system so screens never drift · state management, navigation, and offline-aware flows.

CareConnect: three Flutter apps — mother · babysitter · admin — from one design system.

Backend

Python · Flask

An orchestration layer between the app and everything behind it.

REST APIs the mobile client talks to · request routing (intent → the right service) · auth-gated endpoints and input validation · business logic kept off the client.

BloomBelly: a Flask orchestrator routes each request to one of three AI models.

Database & Access

Supabase · PostgreSQL

One source of truth, with access rules the apps can't bypass.

Relational schema as the single source of truth · row-level security (RLS) enforcing role boundaries · role-based access (mother / babysitter / admin) · rules enforced in the database, not in each app.

CareConnect: one Postgres + RLS, so three apps physically can't read each other's data.

AI

Gemini · LoRA · Random Forest

Three models, each for the job it's actually good at.

Vision understanding with Google Gemini · Arabic Q&A via a LoRA-tuned transformer with calibrated refusals · nutrition scoring with a Random Forest model · all orchestrated behind one Arabic-first interface.

BloomBelly: three AI models behind a single maternal-health interface.

Business Systems

Odoo 19 · ORM · QWeb · OWL

The ERP and operations a business runs on day to day.

Custom Odoo modules (ORM models, QWeb, OWL components) · token-secured email approval flows · auto-journaling on finance sign-off (account.move) · scheduled jobs and QWeb PDF digests.

Smart Expense Manager: submit → approve → post, with the journal entry generated automatically.

Decision log — the judgment behind the work

Anyone can list technologies. These are real decisions from the projects — the cheaper default I turned down, the call I made instead, and what it cost.

PRODUCT

Why three separate apps instead of one role-switching app?

EASY PATH A single app with role-switching is cheaper to build — one codebase, one store listing, one onboarding. Most marketplaces ship this way.

I CHOSE Three apps. Each audience has a different primary action and vocabulary, so each gets a focused navigation and a store listing that says exactly what it does — no "you are logged in as: Mother" cognitive load.

TRADE-OFF Higher initial build cost, but every surface stays honest to its audience.

CareConnect

BACKEND

Why Supabase + RLS over Firebase + client-side guards?

EASY PATH Firebase is the default for student marketplaces — auth + Firestore is fast to wire. But its security rules are a JSON DSL that's easy to get subtly wrong, and the client can be modified.

I CHOSE Postgres + Supabase RLS. Policies are real SQL, run on every query, and can't be bypassed from the client — a mother's query physically cannot return another mother's bookings.

TRADE-OFF More operational overhead, but the security model is auditable, and it's what made the three-app design viable.

CareConnect

AI

Why three AI models instead of one capable LLM?

EASY PATH A single fine-tuned LLM could answer questions, classify nutrition, and describe images — one model, one screen, one deployment surface.

I CHOSE Three specialized models — Gemini for vision, a LoRA-tuned transformer for Arabic Q&A, Random Forest for nutrition — each with a purpose-built screen designed around how that capability is actually used.

TRADE-OFF More to maintain, but each model stays auditable in isolation — critical in healthcare — and users pick the right tool instead of one modal that does everything.

BloomBelly

AI

Why design the AI's refusal as a feature, not an error?

EASY PATH A confident chatbot that always answers demos well. But one that hallucinates dosages is dangerous in maternal care.

I CHOSE Below a confidence threshold the bot returns "Consult your doctor / استشير طبيبك" — designed as a warm, first-class state in Figma, not a red error box.

TRADE-OFF Fewer impressive demo answers, but the product is safe to put in front of real mothers. Trust over benchmark.

BloomBelly

SYSTEMS

Why post the journal entry on approval, not on submission?

EASY PATH Auto-creating the journal entry the moment an employee submits is a simpler state machine.

I CHOSE The `account.move` is generated only on the finance-approval transition. Until then the request is just an HR record.

TRADE-OFF An extra state to manage, but the ledger stays clean — accountants only ever see entries that are real liabilities, never unapproved ones to reverse.

Smart Expense Manager

DESIGN

Why design RTL-native instead of mirroring the LTR layout?

EASY PATH RTL is usually shipped as a visual mirror of an LTR layout — flip direction, swap icons, done. It always feels foreign to Arabic readers.

I CHOSE The Figma file and every Flutter screen was designed in Arabic first — reading direction, hierarchy, spacing, and icon choices all made in RTL context, then adapted for LTR.

TRADE-OFF Slower to design two-directionally, but the Arabic interface reads as the primary version. Because it is — LTR is the adaptation.

Mademoiselle

Education & certifications

B.Sc. Information Technology Engineering

Al-Sham Private University (ASPU) • 2025

Graduation thesis: BloomBelly — an Arabic-first maternal-health app with three AI models, designed in Figma and built end-to-end in Flutter.

Odoo Functional Certification

Odoo S.A. • 2025

Backed by the Techno Solution & Burgasm production implementations.

1 Million Promoters

Dubai Future Foundation • 2025

Backed by the three-model AI integration in BloomBelly.

CONTACT

Let's build something meaningful.

Open to product engineering, product design, and Flutter roles — remote and early-stage especially, and bilingual or Arabic-first products. Usually replies within a day. Email is the fastest way to reach me.
